

## Guidelines for data delivery

### Page size

The page size has to be equal to the size of the end product.  
All sizes exceeding 5000 mm have to be created in 10%.

### Bleed

Please prepare the files with an additional 10mm bleed on all sides and crop marks.

### Image resolution

For best printing results, we recommend an image resolution of at least 100 dpi for the actual trimmed image size in the layout.  
Line drawings (logos etc.) should have a resolution of 1,200 dpi; vectorised files, are preferred.

### Process colours

Please always use the CMYK colour space. RGB colours will be converted into CMYK. The refining process could lead to considerable deviations from the original colour.

### Cut contour in special colours/spot colours

Always create cut contours (print & cut) in special colours, please make sure to define them as spot colours.  
Otherwise those colours will appear in the print layout.

### Fonts

All used fonts must be converted into vectorised paths.

### Data delivery

Via e-mail (up to 5 MB) to [info@fvf-ag.ch](mailto:info@fvf-ag.ch)  
Via data transfer: [www.wetransfer.com](http://www.wetransfer.com)

Please note: Late or unsuitable templates will result in additional costs.
